

ABSTRACT

A cover for an electronic component has a frame with a wall disposed thereon so that the frame causes the wall to be substantially rigid. A first end-panel is substantially permanently or removably attached to the wall. A second end-panel can be one of removably attached to the wall opposite the first end-panel, substantially permanently attached to the wall opposite the first end-panel, or selectively removably attachable to the wall opposite the first end-panel to cover a front of the cabinet, when the electronic component is not being actively used by a user. The cover may extend to cover cables extending from the cabinet.
